ABSTRACT

Adult onset Still’s disease is a rare inflammatory disorder characterized by daily spiking fevers, arthritis and an evanescent rash, typically affecting young adults. Diagnosis is clinical, based on the widely used Yamaguchi criteria [1]. Adult onset Still’s disease is an uncommon presentation which has been infrequently described in literature [6]. Common laboratory findings in AOSD include neutrophilic leukocytosis, very high ESR and C-reactive protein, anemia of chronic disease, elevated ferritin levels (higher than five times the upper limits of normal) and hypoalbuminemia [6,7]. We present a case of AOSD presenting as recurrent fever complicated by acute respiratory distress syndrome (ARDS), an uncommon presentation of AOSD which has rarely been reported in literature.

CASE PRESENTATION

Our patient, a 33 year old Hispanic male, presented with 1 month history of daily fever, neck pain and sore throat and a rash on his arms. During an ED visit, 3 months earlier, for right neck swelling and cough, he was diagnosed with upper respiratory tract infection and cervical lymphadenopathy. He had 10 pack year smoking history and denied alcohol or drug abuse. On exam, he had a temperature of 102.3°F, HR 115, RR 15, BP 88/ 47 mm Hg and SpO2 97% on room air. Neck was supple with bilateral nontender cervical lymphadenopathy. Other exam findings included nontender splenomegaly and mild maculo-papular erythematous rash on chest and arms.

Lab values were significant for a WBC count of 14.6 (84.8 % polymorphs), hemoglobin 10.4 g/dl, hematocrit 32, MCV 80, sodium 131, AST 93, ALT 33 and albumin 2.5. His procalcitonin was 0.6. Initial diagnosis was SIRS (Systemic inflammatory response syndrome), with likely sepsis from meningitis. Other infectious and non-infectious etiologies such as lymphoma were considered. CT scan showed enlarged cervical and mediastinal lymphadenopathy. Anemia work up showed low transferrin, normal transferrin saturation but significantly elevated ferritin of 23,350. CSF analysis showed WBC of 21 with 95% lymphocytes, normal glucose and normal protein. ESR was elevated at 100. TB (T Spot), RPR, RF, ANA and ds-DNA were negative. Infectious workup was negative for histoplasma urine antigen, parvovirus B19, Borrelia, Rickettsia, Bartonella, Schistosoma and CMV serologies. Bacterial, Fungal and Mycobacterial cultures from blood, urine, CSF and bone marrow were negative. Patient underwent left sided cervical lymph node excisional biopsy. Patient clinically improved and was discharged with follow up for lymph node biopsy and bone marrow biopsy results.

Patient presented two weeks later with recurrent fever, SIRS and hemoglobin of 8. Bone marrow biopsy showed hypercellular marrow without evidence of neoplasm. Lymph Node biopsy showed follicular lymphoid hyperplasia. Presumptive diagnosis of adult onset Still’s disease was entertained for Fever of Unknown Origin with workup...
negative for infectious and neoplastic etiologies. Patient’s presentation with lymphadenopathy, arthralgia, pyrexia, sore throat, leukocytosis, elevated ferritin and splenomegaly supported the diagnosis of adult onset Still’s disease.

Patient subsequently developed respiratory distress and was placed on mechanical ventilation for ARDS. Bronchoscopy with lavage was negative for malignancy and infections. Echocardiogram showed ejection fraction of 55% and Transesophageal Echocardiogram was negative for any vegetations. He started on intravenous methylprednisolone 1 gm daily for three days followed by oral prednisone. He responded well with successful extubation and was later discharged on slow tapering dose of oral prednisone. Patient remained afebrile and ferritin decreased from more than 23,000 to 4,000. Patient follows up regularly in our rheumatology clinic and is doing well. The interesting feature in our patient was ARDS, which has been infrequently described in literature in Still’s disease.

DISCUSSION

Adult onset Still’s disease is a clinical diagnosis. Our patient had at least 3 major criteria and 3 minor criteria for AOSD. While recurrent febrile episodes with arthralgia and rash is the typical presentation, less common AOSD manifestations include pericarditis, valvular abnormalities, thrombotic thrombocytopenic purpura, interstitial nephritis and neurological manifestations like cranial nerve palsies, seizures and aseptic meningoencephalitis. Pulmonary manifestations are infrequent and include pleurisy, cryptogenic organizing pneumonia [8], diffuse alveolar hemorrhage [9] and ARDS. Rare instances of ARDS have been described in literature in relation to AOSD [10-12] as well as treatment of AOSD with anakinra [13]. Treatment options for AOSD include nonsteroidal anti-inflammatory drugs, systemic corticosteroids and traditional immunosuppressants with methotrexate being the most common [7]. Anakinra [14] is the primary biological agent used in AOSD, while other agents such as infliximab, etanercept, tocilizumab and canakinumab have also been used. Alternate regimens include leflunomide, cyclosporine, intravenous immune globulin, azathioprine, cyclophosphamide, tacrolimus and gold. Periodic evaluation for disease activity and adverse effects of treatment as well as monitoring of disease markers is needed.

CONCLUSION

Advances in radiological and laboratory investigations notwithstanding, fever of unknown origin continues to represent a significant diagnostic challenge to clinicians. Our patient had multiple ED visits and hospitalizations with extensive workup prior to being diagnosed with AOSD based on Yamaguchi criteria and negative workup for infectious and neoplastic etiologies. His clinical course was complicated by ARDS which is an unusual presentation and responded well to steroids. This case reflects the importance of considering AOSD in differential diagnosis of recurrent fever, especially in young patients and the need to recognize ARDS as a potential but rare complication.

CONSENT

Written informed consent was obtained from the patient for publication of this case report and any accompanying images. A copy of the written consent is available for review by the Editor-in-Chief of this journal.

AUTHORS’ CONTRIBUTIONS

SS summarized the hospital course. PG summarized the diagnostic workup and reviewed literature. AT reviewed AOSD management. PG, SS, and AM contributed in writing the manuscript. All authors read and approved the final manuscript.
